

Back to milestone 2

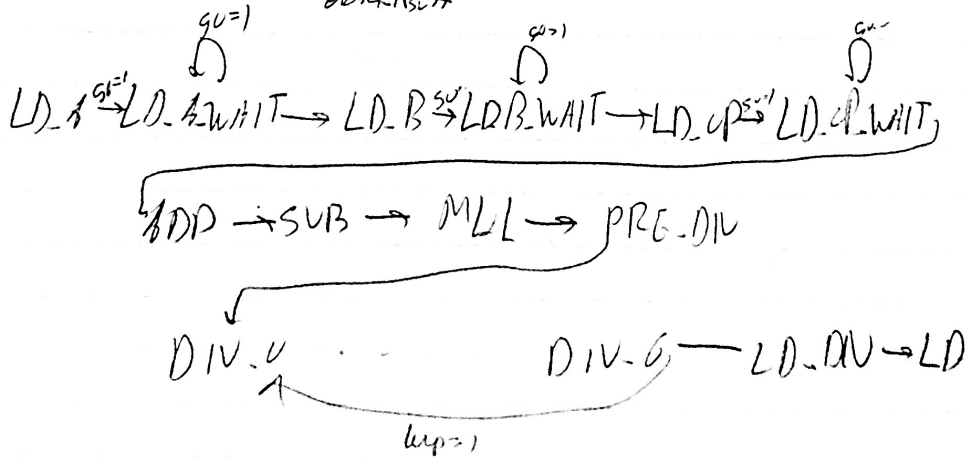

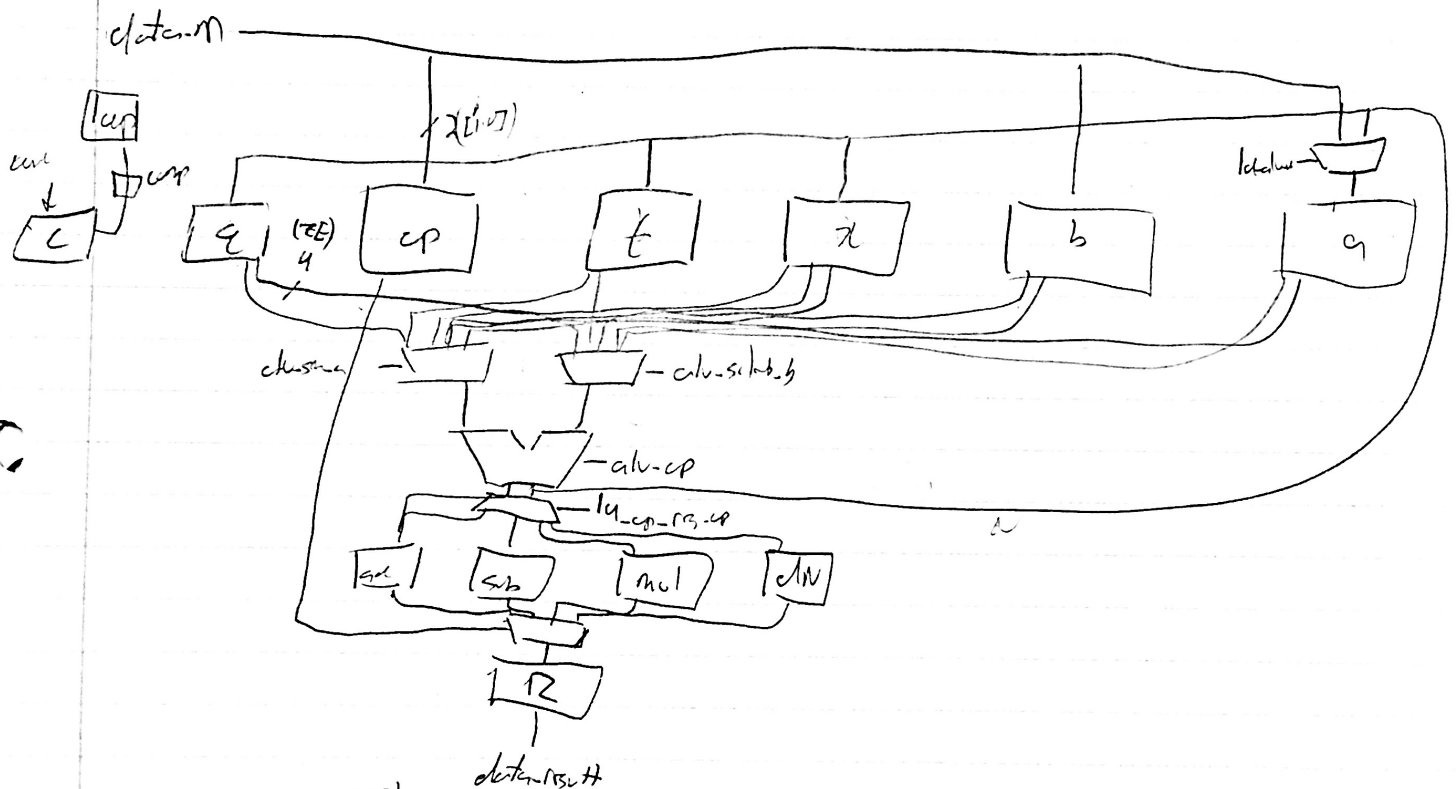

let's infer the state of the controller?
 in particular let's look at the bus signals.
 what's probably happen?
 bus has issues.

we know the other ops work as well!

maybe we should trace the data bus to see what's going on
 it's also possible the algorithm is wrong

we could add output regs to datapath to see what's going on?

code in 804-PS
